- Then this is just a car...

Meet the Koenigsegg CCXR 2008

- And this is just a truck.

Meet the largest truck in the world.

## Swiss army chainsaw

- Emacs started in the 1976
- Written by Richard Stallman
- Now in its 26th version
- Multi-platform
- Used to be a hog, now who cares
- Programmable
- Has modules for everything

Emacs (Editor MACros) v 1 was released in 1976. It was co-authored by Richard Stallman, Mr. GNU himself.

GNU Emacs development started in 1984 and is quite active.

Emacs is very customizable. It can be programmed in Elisp, a variant of LISP.

A small core is written in easily portable C, the rest is Elisp.

Out of the box, Emacs has 2000 functions. You can add more.

Emacs lets you define and record key macros if you don't want to touch Elisp

Vast libraries of modules give you access to specialized functions and “modes” for every kind of editing, language, text formats, etc.

## Installing Emacs

- On Debian-like Linux:  
apt-get install emacs
- On RedHat-like Linux:  
yum install emacs
- Some popular modules have been packaged for most distros.
- You can install a text-only version.

Emacs is pre-packaged in most Linux distros. You can also install popular modules (Elisp files, really) from Linux repos.

Example: The Ubuntu repo has 317 packages containing the word “emacs”.

There are also Emacs forks such as xemacs – not useful for beginners.

Emacs starts in window mode on desktops by default.

You can force a text version with `emacs -nw`

Systems with no graphics card can use `emacs-nox` which doesn't install X11.

## Starting Emacs

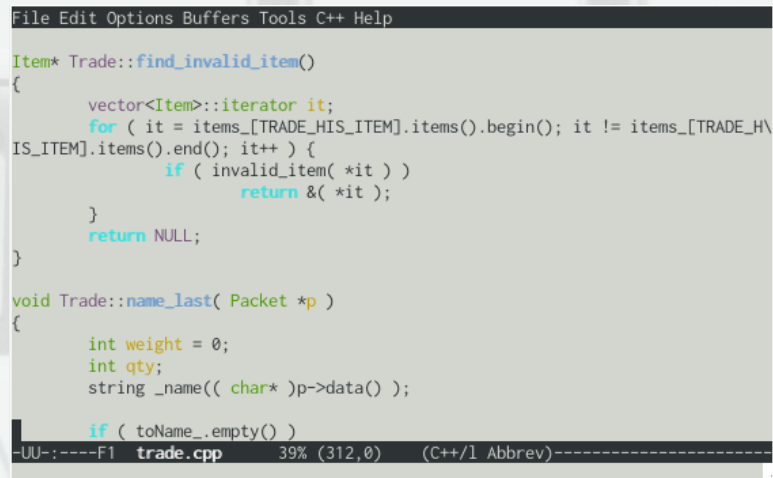

- Click the desktop icon, or...
- From a terminal, run emacs myfile
- At startup, Emacs loads the installed modules, then reads your ~/.emacs file.
- That's where your customization resides.
- Life savers:
  - **C-x C-s** Saves current buffer
  - **C-x C-c** Quit Emacs
  - **C-g** Cancel an ongoing command
  - **C-\_** Undo

“Dangerous” commands that can result in data loss are prefixed by **C-x** to minimize accidental key strokes.

Undo is unlimited

## Emacs in text mode

```
File Edit Options Buffers Tools C++ Help

Item* Trade::find_invalid_item()
{
    vector<Item>::iterator it;
    for ( it = items_[TRADE_HIS_ITEM].items().begin(); it != items_[TRADE_HV
IS_ITEM].items().end(); it++ ) {
        if ( invalid_item( *it ) )
            return &( *it );
    }
    return NULL;
}

void Trade::name_last( Packet *p )
{
    int weight = 0;
    int qty;
    string _name(( char* )p->data() );

    if ( toName_.empty() )
-uu-:----F1 trade.cpp 39% (312,0) (C++/1 Abbrev)-----
```

Here, we open a C++ file in a terminal without X

Notice the syntax highlighting

Notice the line mode at the bottom. It contains

interesting info: Buffer name, character set, current line and column, mode

Here, the mode is C++ (auto-detected from file extensions)

Notice now the top menu. It contains standard entries as well as mode-related entries (here, C++ mode)

Modes offer specific functions for a certain type of files.

Most modes are agnostic (work in graphic and text mode). A few modes are graphic-only.

## Text mode menu

- In text mode, **F10** or **M-`** to access the Emacs menu

```
File Edit Options Buffers Tools Minibuf Help
int weight = 0;
int qty;
string _name(( char* )p->data() );

if ( toName_.empty() )
    return;
Item &i = *( toName_.back() );

-UU-:----F1 trade.cpp 41% (312,0) (C++/1 Abbrev)-----
Press PageUp key to reach this buffer from the minibuffer.
Alternatively, you can use Up/Down keys (or your History keys) to change
the item in the minibuffer, and press RET when you are done, or press the
marked letters to pick up your choice. Type C-g or ESC ESC ESC to cancel.
In this buffer, type RET to select the completion near point.

Possible completions are:
f==>File          e==>Edit          o==>Options
b==>Buffers      t==>Tools         c==>C++
h==>Help

-UU1:%*--F1 *Completions* All (1,0) (Completion List)-----
Menu bar (up/down to change, PgUp to menu): f==>File
```

The Emacs doc denotes the Meta key as M. This is mapped to Alt or Esc on PC keyboards.

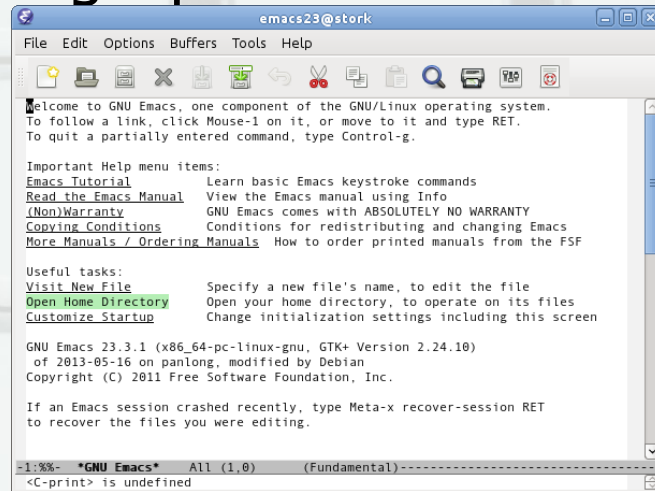

It shows the control key as C. So

C-x = Control-x

M-x = Alt-x

While you can use the menus in text mode, you are highly encourage to learn the shortcuts, or to use function names.

## Emacs start-up screen, graphics mode

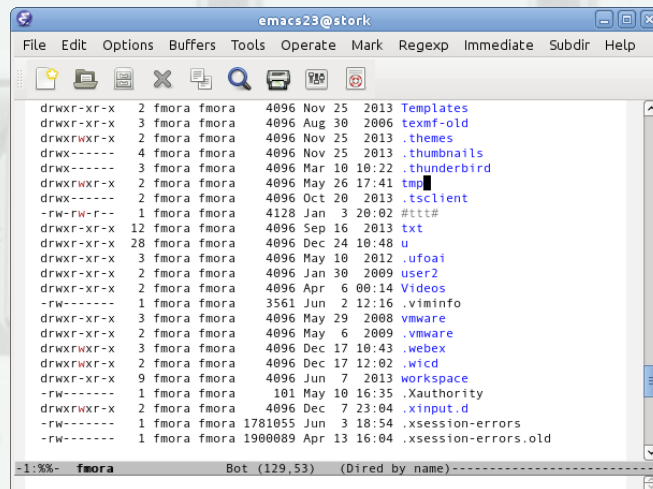

The default start-up screen offers a tutorial that is highly recommended.

Interesting options are “Visit new file” (“visit” is Emacs jargon for “open in a buffer”<sup>o</sup>) and “Open Home Directory”. This, by itself, is a nice “trick”. Let's look at it.

In graphics mode, just click on the option.

# Directory edit (dired) mode

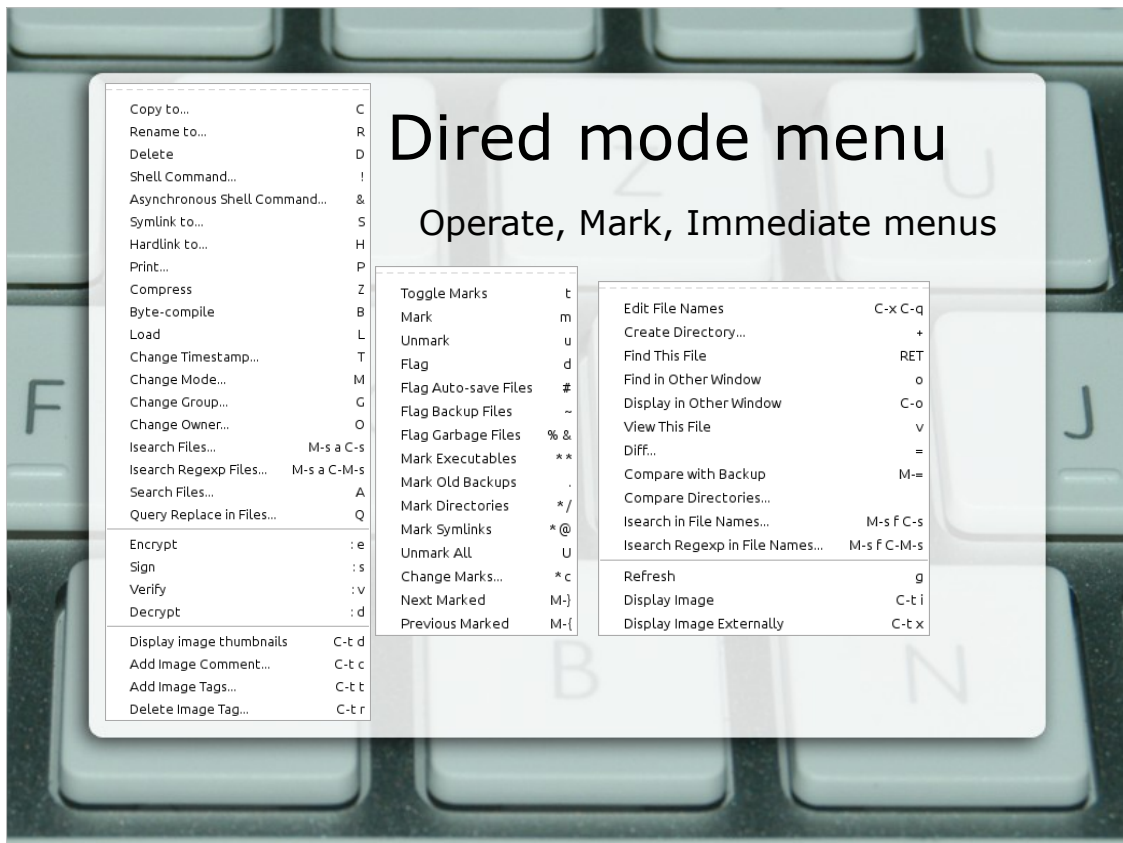

The screenshot shows the Emacs editor window titled 'emacs23@stork'. The menu bar includes 'File', 'Edit', 'Options', 'Buffers', 'Tools', 'Operate', 'Mark', 'Regexp', 'Immediate', 'Subdir', and 'Help'. The main window displays a directory listing in dired mode, sorted by name. The listing shows permissions, file size, owner, group, modification time, and filename for various files and directories. The mode line at the bottom reads '-1:~%~ fмора Bot (129,53) (Dired by name)-----'.

```

The mode line tells us we are in Dired mode, sorted by name.

Note the mode-specific menus. We can operate on files, create subdirs, search files, etc. This is very similar to file explorer programs.

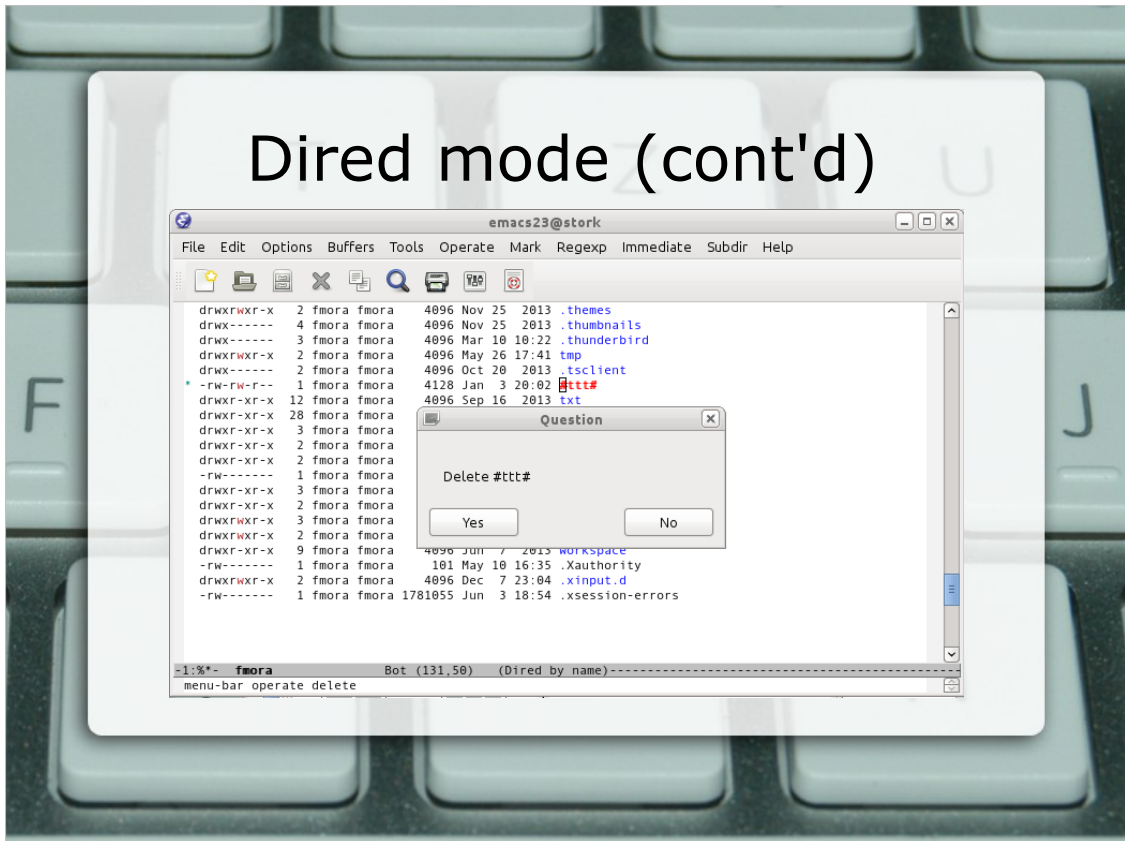

Here is a sample of the menus available in the Dired mode.

Users that are still intimidated by the shell will find equivalent for most of the usual shell functions.

More generally, this gives you an idea of the depth of available Emacs modules.

## Dired mode (cont'd)

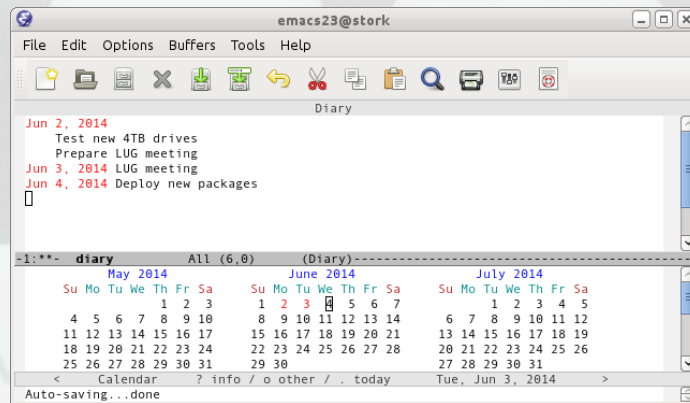

Here, I marked the file and selected Delete in the Operate menu.

Since I selected the menu, Emacs puts me in the keyboard-shy category and shows GUI dialog. Had I used the keyboard shortcut, the dialog would have appeared on the mode line.

# Calendar mode

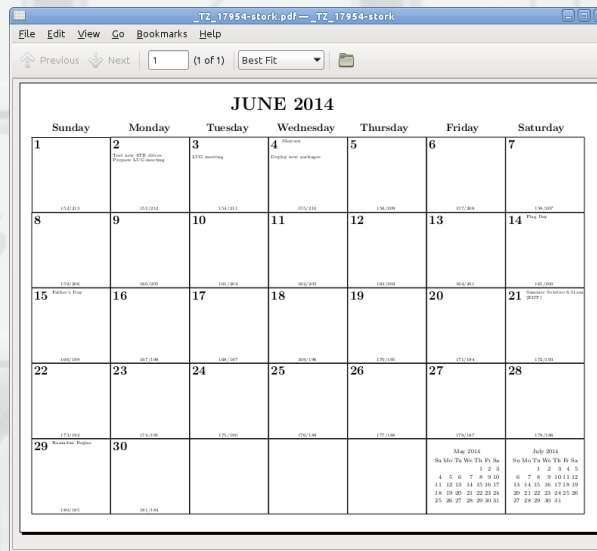

- Lets you organize your days, save diaries –  
If you hate GUI calendars

Right-click on a date to see possible operations.  
The diary is a standard text file.

## Calendar mode (cont'd)

- I still use this mode to print wall calendars

In calendar mode, put the cursor on a month, type **t M**, and a LaTeX file is created that contains a printable calendar.

If you don't know what LaTeX is, we need another session about it.

Save the file.

**M-x tex-buffer** creates a DVI file

Unless your printer is very smart, don't do **M-x tex-print** or you'll print a ream of binary file

Do the usual:

**dvipdf file.dvi**

Then view or print the resulting PDF.

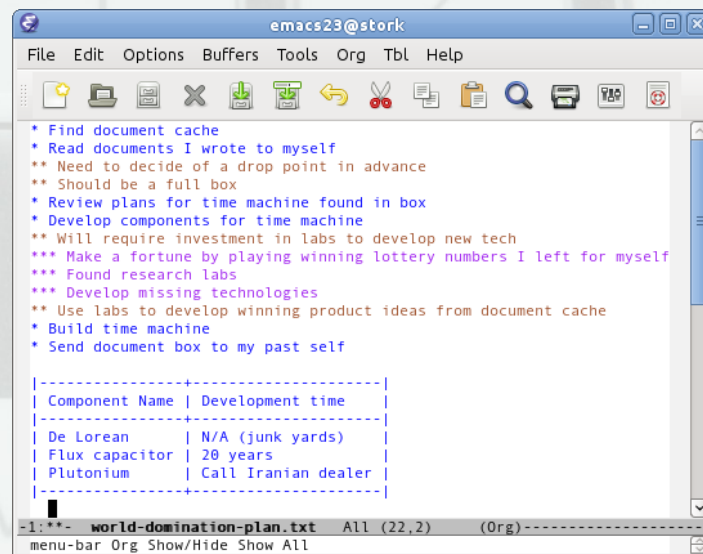

## Org mode

- Very popular module
- Installable with `apt-get install org-mode` or `yum install org-mode`
- Good for keeping notes, maintaining TODO lists, and doing project planning with a fast and effective plain-text system.
- Lets you create text tables quickly
- Also provides a text-mode spreadsheets!

This space intentionally left blank.

## Org mode: Bullet lists and tables

The screenshot shows an Emacs window titled 'emacs23@stork' with a menu bar (File, Edit, Options, Buffers, Tools, Org, Tbl, Help) and a toolbar. The main text area contains a bullet list and a table. The bullet list items are: '\* Find document cache', '\* Read documents I wrote to myself', '\*\* Need to decide of a drop point in advance', '\*\* Should be a full box', '\* Review plans for time machine found in box', '\* Develop components for time machine', '\*\* Will require investment in labs to develop new tech', '\*\* Make a fortune by playing winning lottery numbers I left for myself', '\*\* Found research labs', '\*\* Develop missing technologies', '\*\* Use labs to develop winning product ideas from document cache', '\* Build time machine', and '\* Send document box to my past self'. Below the list is a table with two columns: 'Component Name' and 'Development time'. The table rows are: 'De Lorean | N/A (junk yards)', 'Flux capacitor | 20 years', and 'Plutonium | Call Iranian dealer'. The status bar at the bottom shows '-!:\*-- world-domination-plan.txt All (22,2) (Org)-----' and 'menu-bar Org Show/Hide Show All'.

```
* Find document cache
* Read documents I wrote to myself
** Need to decide of a drop point in advance
** Should be a full box
* Review plans for time machine found in box
* Develop components for time machine
** Will require investment in labs to develop new tech
** Make a fortune by playing winning lottery numbers I left for myself
** Found research labs
** Develop missing technologies
** Use labs to develop winning product ideas from document cache
* Build time machine
* Send document box to my past self

-----
| Component Name | Development time |
-----
| De Lorean      | N/A (junk yards) |
| Flux capacitor | 20 years          |
| Plutonium     | Call Iranian dealer |
-----
```

- Very good for managing hierarchical lists of concepts, table of contents, or project tasks
- Promote/demote subtrees of items
- Fold/unfold subtrees
- Text tables can be useful every time you have to create a table for adding to a Readme file, a code comment, and other text-only files.
- <http://orgmode.org>

You can do much, much more with Emacs. There are tons of online tutorials.
